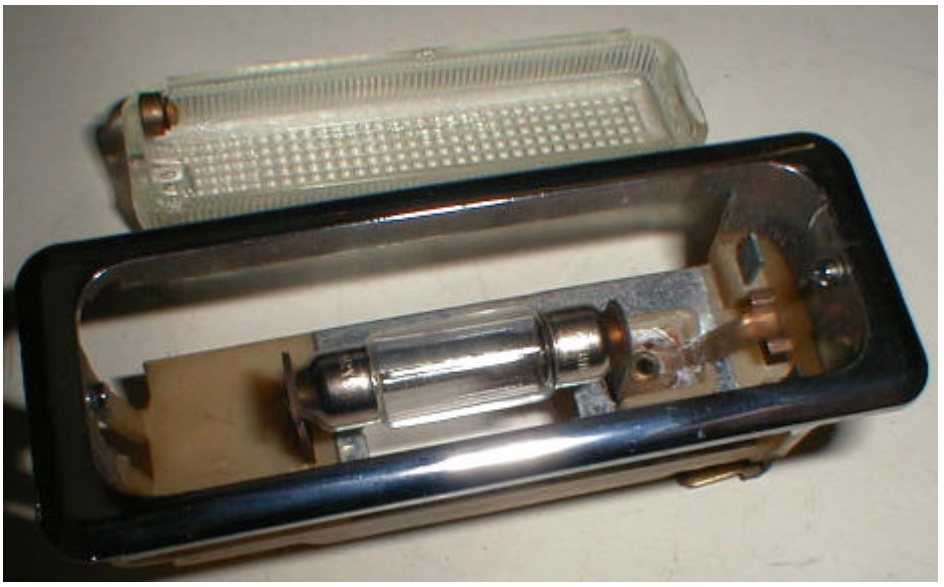
No 2 Refurbishing Door Lights

Door lights for the TR7/8 haven't been available for some time so if yours don't work well or have gone a sort of dark dirty shade here's how to breathe new life into them.

(1) With the aid of a small instrument screwdriver gently edge the plastic lens out of its holder.



"At this point the main copper contact can also be bent back into shape"

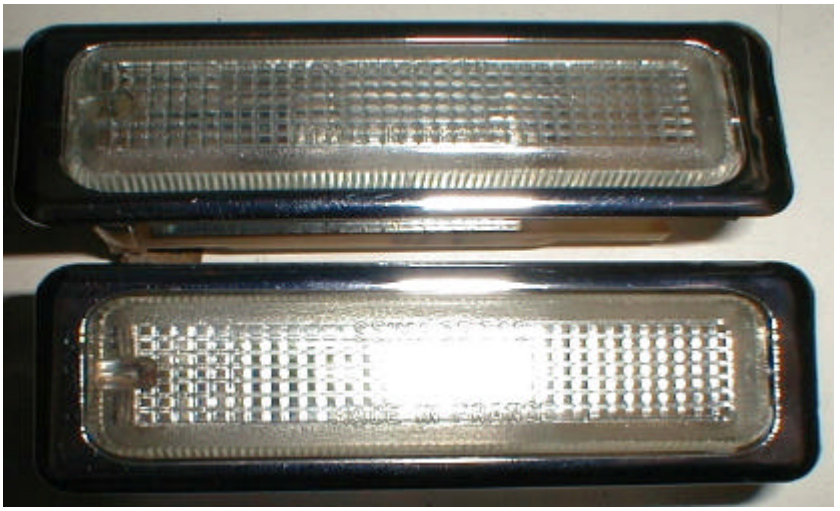
(2) Again with a small instrument screwdriver gently clean up the contacts by scraping the corrosion off. At this point the main copper contact can also be bent back into shape .

(3) To clean the lens use a whitening toothpaste on a soft brush and gently clean without water – do not be tempted to put too much pressure on as you may scratch the lens – light pressure will work fine.

(4) Here you can see a before and after where you can clearly see the difference

"Use a Whitening toothpaste on a soft brush"

(5) Before you put the light back together you need to clean the light reflector on the base, as you can see here even a corroded surface will clean up a bit.

"Finished article as good as new"


(6) Then very carefully ease the lens cover back into place – well worth taking your time at this point without trying to force it in as it would be a shame to break the lens at this point. Finished article as good as new!
